**REPORT OF CLASSIFICATION COMMISSION
CLASSIFICATION OF BENEFITS FOR
DRAINAGE DISTRICT NO. 6
WORTH COUNTY, IOWA
2026**

We, Nathaniel Julseth and Mike Stevens, landowners in Worth County, and Jonathan Rosengren, engineer, are the commissioners duly appointed to reclassify lands within the boundaries of Drainage District No. 6 in Worth County, Iowa. Pursuant to our appointment we have examined each and every benefited parcel within the district. Each section or small tract of land within the district has been classified and the percentages of benefit each parcel derives from the several district facilities have been determined.

These laterals of Drainage District No. 6 were last reclassified in 1947, and are currently operating under this classification. As of this time, no improvements are being proposed to the district as a whole, however an investigation of Lateral 7 is currently underway. Maintaining individual schedules for the several district facilities allows remonstrance rights to be limited to only those lands that are benefited by the improvement, rather than possibly including lands that would not benefit.

We recommend and report eighteen assessment schedules herein to be used for payment of future maintenance and other costs of each of the separate facilities as may arise.

Accordingly, we herewith submit our report. The schedule presents in tabular form for each benefited parcel:

- 1) The names of the owners thereof as shown on the transfer books in the Auditor's office
- 2) The parcel number
- 3) The number of benefited acres
- 4) The classification or percentage of benefits derived relative to a 100% benefit assigned to the tract having the greatest benefit
- 5) Apportionment of the assessable units according to our classification of the benefited lands

Units assessed can also be viewed as a conceptional dollar assessment amount, assuming the total assessment is equal to the total assessable units for a particular schedule.

The schedules also show benefits to the county secondary roads and state highways. Included with this report are plats of the benefited land for each assessment schedule. It is the recommendation of the commissioners that this report be adopted.

Respectfully submitted,

Nathaniel Julseth 8-15-25
Resident Freeholder Date

Mike Stevens 8-15-25
Resident Freeholder Date

Jonathan P. Rosengren August 15, 2025
Professional Engineer No. 21661 Date

Background Information

A. District Facilities

Drainage District No. 6 consists of an open ditch approximately 3.5 miles long that drains to a natural creek flowing south into Elk Creek Marsh Wildlife Area. The district also includes 18 lateral tiles and three lateral open ditches. Construction of the district was completed in 1909 with repairs and improvements completed in 1948 and 1963. A table of all the district facilities is shown on the next page.

Approximately 5,383 acres are served by the DD 6 Main Open Ditch, including approximately 620 acres located within DD 38. DD 38 is a tile district wholly contained within the watershed of DD 6 and which relies upon the DD 6 Main Open Ditch as its outlet. DD 38 was reclassified in 2019.

B. Landscape

The district’s land is typical of Worth County, largely devoted to row crop corn and soybean production with a few tree-lined acreages and marsh, woodland and CRP/grass.

The primary soil complexes in the watershed are Okoboji-Harps and Webster-Nicollet-Clarion and Kilkenny soil. The Okoboji-Harps soil complex is very poorly drained, Webster soils are poorly drained, and Nicollet, Kilkenny and Clarion soils are less poorly drained.

C. History

The existing schedule was last reclassified in 1947, except for additional lands annexed with the construction of Lateral 9-Y in 1965.

Existing DD 6 Facilities				
Main Open Ditch	Lateral 3 Tile			
	Lateral 4 Open Ditch			
	Lateral 5 Tile			
	Lateral 6 Tile			
	Lateral 7 Open Ditch	Lateral 7 Tile	Lateral 7A Tile

	Lateral 8C Tile		Lateral 8C-1	
	Lateral 9 Open Ditch		Lateral 9X Tile	
			Lateral 9Y Tile	
			Lateral 9A Tile	
			Lateral 9B Tile	
Lateral 9C Tile				
Lateral 9D Tile				

Methodology

In accomplishing reclassification, Iowa Code 468.40 lays out the rules for classification.

"In estimating the benefits to the lands..... only the benefits which will be received by reason of the construction of the improvement in question as it affords an outlet to the drainage of such lands or brings the outlet nearer to said lands or relieves the same from overflow and relieves and protects the same from damage by erosion.

When the land is a state-owned lake or state-owned wetland, the commissioners shall ascertain the benefits realized from removing excess water and shall not consider any benefit realized if the state-owned lake or state-owned wetland were drained or converted to another land use."

The construction of the improvement cited in the above code section is referring to the original construction of the open ditch and/or tiles at the time of district establishment. There are no plans to improve the current district facilities at this time.

The rules outline three benefits in which the classification determines benefit:

1. As it affords an outlet to the drainage of such lands;
2. Brings the outlet nearer to the lands; and/or
3. Relieves the land from overflow and relieves and protects from erosion.

We refer to the three factors for calculating benefit as: Proximity; Use; and Wetness and Runoff. The process of reclassification uses these factors to equitably spread project costs based upon benefits received.

1. Affording an outlet to drainage is the Proximity Factor. This considers the portion of the outlet provided. Lands nearer to the ditch receive a higher assessment because they have easy access to district facilities. Lands farther from the facility must invest in additional private drainage to access the facility. Therefore, a 40 acre tract which is crossed by a ditch benefits more than a 40-acre tract a mile away which must build a private system to reach the open ditch.
2. Bringing the outlet nearer to your lands is the Use Factor. This considers how much of the facility is required to bring an outlet to a particular location. The more of a facility that is used by any given property, the higher the Use Factor on that property. A parcel using one mile of a facility benefits less than a parcel using 5 miles of the facility.
3. Relieving your land from overflow and protecting your land from erosion are ways your property responds to improved drainage. The Wetness Factor as it's commonly called accounts for the soil types' varying natural wetness and need for drainage. Wet soils in a pothole are highly benefitted because the soils have more need for drainage than drier soils on the hill tops. This translates to a greater benefit for parcels with wetter soils as those parcels are relieved from overflow. Upland soils still receive benefit from improved drainage, and protection from erosion, as upland soils are more likely to erode due to surface runoff which can be controlled through improved drainage. We also use what we call a runoff factor to account for land areas that shed water off their properties quicker than agricultural land. These properties rely on the drainage district to remove their water quicker. State and county roads are examples of hard surface areas that shed water quicker than agricultural lands.

Benefits of Drainage

The primary benefit of drainage is increased agricultural productivity. We have included some of the agricultural benefits of Drainage District No. 6 as described by Ohio State Professor Mel Palmer. Below are listed the benefits as described by Professor Palmer.

- Better Soil Aeration results from good drainage (surface water and free water in the root zone removed within 24 hours after heavy rainfall). This permits extensive root development and a more favorable environment for beneficial soil micro-organisms and earthworms. When soil aeration is reduced, the severity of soil-borne root is increased.
- Better soil moisture conditions with good drainage permit more efficient operation of tillage, planting, and harvesting equipment.
- Better soil structure can be developed and maintained with good drainage by reducing compaction when working soil that is too wet.
- Soils warm up quickly in the spring when free water is removed by a drainage system. This results in better seed germination and an increased rate of plant growth.
- An increased supply of nitrogen can be obtained from the soil when drainage lowers the water table in the root zone. Denitrification often occurs in soils with poor drainage.
- Longer growing seasons can be achieved with good drainage due to earlier possible planting dates. This also permits the use of higher-yielding crop varieties or extended grazing periods for livestock.
- Certain toxic substances and disease organisms are removed from the soil due to better drainage and soil aeration. In wet soil, roots can be injured by toxic substances produced in the reduction of iron and manganese salts and the reduction of nitrates to nitrites.
- Winds are less liable to uproot plants growing in soils that have been properly drained since root systems are deeper.
- Soil erosion and sediment loss can be reduced by subsurface drainage since drained soils have a greater capacity to absorb rainfall and the soil filters out suspended sediment.
- Good drainage saves fuel that would be used in working around wet areas in fields that are not properly drained. Also, since drained land is easier to work, there is less need for dual wheels or four-wheel drive tractors.
- Good drainage reduces winter crop damage such as frost heaving of alfalfa and smothering of wheat and cover crops under patches of ice.
- Good drainage promotes earlier crop maturity and earlier fall harvests when climatic conditions are better for natural drying of grain in the field, thereby saving artificial drying costs.
- A greater variety of crops can be grown on a farm that has good drainage. Alfalfa and sweet corn are examples of those that a farmer may choose.
- Weed control is easier with good drainage since shallow-rooted weeds and undesirable grasses often thrive in wet soil moisture and nutrients.
- Well-drained grazing land supports more livestock with less compaction damage to vegetation and soil from animal traffic.
- Good drainage reduces diseases that thrive on wet land. These include foot rot and liver fluke that infect livestock, and diseases carried by mosquitoes to both livestock and people.

- Valuable livestock water supplies can be obtained by draining hillside seeps and piping the water to stock water tanks.
- Plants are better able to withstand summer droughts with good drainage since lower water tables in the spring permit deeper root development for extraction of soil moisture and nutrients.
- Drainage is essential for salinity control in drier regions where irrigation is needed for permanent agricultural production.

Acres and non-agricultural properties benefit from drainage district facilities. These properties rely on drainage district tiles and the outlets they provide to lower the water table and keep their basements drier. They are provided storm sewer relief, and their yards, gardens, and trees benefit from the increased soil productivity. Much like residents in town pay for storm sewers, the acres should help pay for drainage districts providing the same benefit.

Roads can be assessed for benefits from a drainage district as outlined in Iowa Code 468.43. Iowa's early roads were muddy. Looking at the early plat of the district establishment, the county roads didn't follow the section lines and instead meandered along the high lands. The roads being drier makes maintenance easier. The roads also have higher runoff due to the hard surfaces. This runoff doesn't soak into the soil but instead quickly goes to the district tiles typically via intakes in the road ditches.

All landowners within the district benefit from the decrease in mosquitoes and the diseases associated with mosquitoes. Today, we don't think about how before drainage districts and other public health measures, malaria was a common disease in Iowa's wetlands. Iowa Code 468.2 even goes as far as stating one of the reasons to construct drainage districts as being conducive to public health, convenience, and welfare.

Overall, good drainage results in higher crop yields, improved public health, and higher land values. Most of these benefits may not be easily recognized as the system has been in place for 100 years now, and no one alive today remembers how this area drained prior to the district establishment. Therefore, when assessing benefits, we must review the historical information and use scientific and mathematical modeling to estimate the benefits.

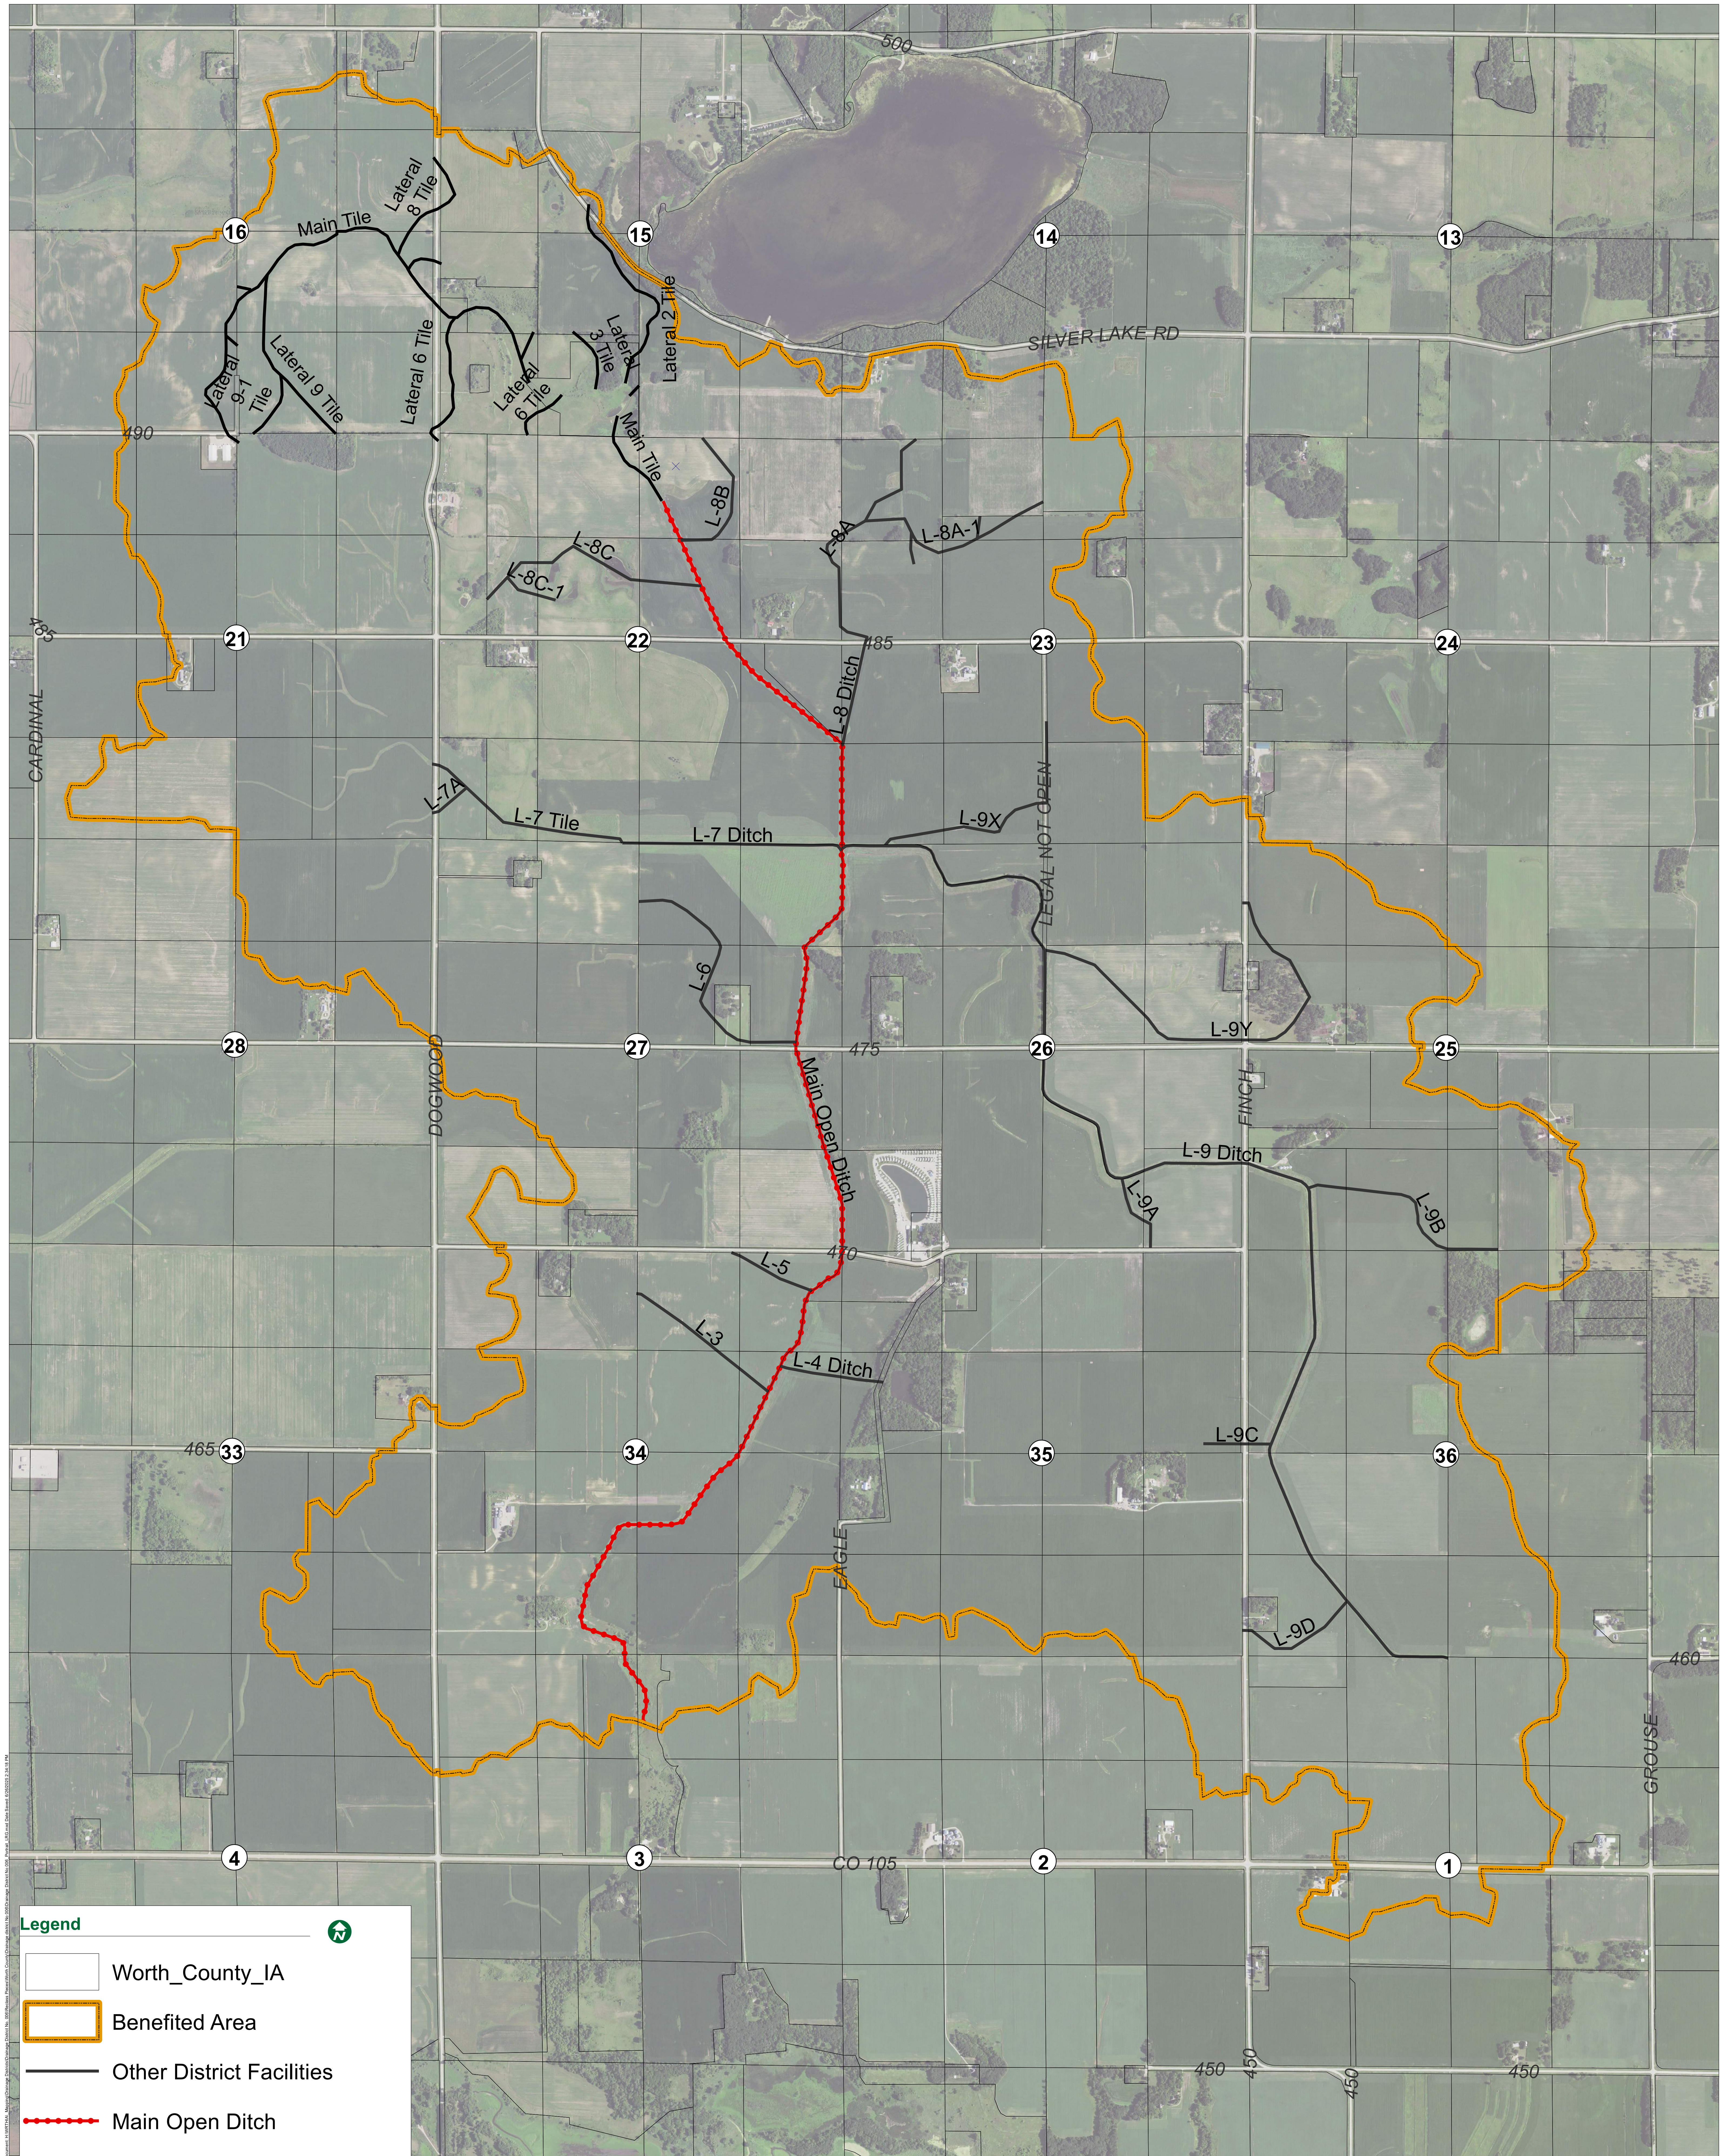

Investigation

To calculate these factors and determine the relative benefits for each parcel, we employed a grid system using hexagons. Each hexagon covers an area of approximately one acre, which provides a comprehensive and precise assessment of the benefitted area. Within each hexagon, three key variables were documented: elevation, soil composition, and land usage. By establishing connectivity between these hexagons, the natural flow paths of water towards district facilities were outlined. The distance of the flow path from each hexagon to its associated district facility was then calculated. All this data, Proximity, Use, and Wetness and Runoff were compiled to determine a relative benefit for each hexagon. Visual representations of these hexagonal areas will be presented during the reclassification hearing to illustrate our approach and findings regarding water management planning.

The assessment schedule assumes that all landowners take advantage of the drainage provided by the drainage district. Iowa Code does not have a method to assign benefits based on the number of private tiles each individual landowner has. It would also be difficult to administrate such a method; it would require landowners to inform the district of any work being done on their lands and every time someone completed any work, the district would need to be reclassified.

Drainage District No. 38 relies on the outlet provided by the DD 6 Open Ditch. Because DD 38 has its own facilities and assessment schedule to maintain those facilities, the only benefits considered in this classification are those benefits derived from the outlet provided by the main open ditch so far as it brings a better outlet closer.
